Customer Account Eligibility

Aim:

To bulid a system using COBOL that decide whether a customer can open a standard account.

Algorithm:

Step 1: Start the program.

Step 2: Accept the values of AGE (as a signed integer) and identity-verification FLAG from the user.

Step 3: Validate the AGE input. If AGE is less than or equal to 0, or greater than 120, print "INVALID AGE" and go to Step 6.

Step 4: Check if the account opening conditions are met: AGE must be at least 18 AND the FLAG must be "Y" or "y".

Step 5: If both conditions are met, print "ELIGIBLE". Otherwise, print "NOT ELIGIBLE".

Step 6: Stop the program.

Code:

```
IDENTIFICATION DIVISION.
PROGRAM-ID. CHECK-ELIGIBILITY.

DATA DIVISION.
   WORKING-STORAGE SECTION.
   01 AGE      PIC S999.
   01 FLAG     PIC X.

PROCEDURE DIVISION.

   ACCEPT AGE.
   ACCEPT FLAG.

   IF AGE = 0 OR AGE > 120 OR AGE < 0 THEN
      DISPLAY 'INVALID AGE'
      STOP RUN
   END-IF.

   IF AGE >= 18 AND
     (FLAG = 'Y' OR FLAG = 'y') THEN
```

```
        DISPLAY 'ELIGIBLE'

    ELSE
        DISPLAY 'NOT ELIGIBLE'
    END-IF.

    STOP RUN.
```

Output:

STDIN

```
-19
Y
```

Output:

```
INVALID AGE
```

STDIN

```
19
Y
```

Output:

```
ELIGIBLE
```

STDIN

```
19
n
```

Output:

```
NOT ELIGIBLE
```

.

Result:

Thus a customer account eligibility using COBOL is executed successfully and

the expected output is obtained.
